                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The amino acid sequence of a part of the 4th exon from the tumour necrosis factor (TNF)-alpha. The protein has the peptide AAR72454 attached to the N-terminal amino acid. The fusion protein can be used in pharmaceutical compositions for inhibiting metastasis.

DNA sequence encoding hTNF was synthesised chemically and inserted into vector plasmid. Recombinant plasmid was cut with restriction enzyme and DNA fragment coding for new bloactive polypeptide was obtd. The new bloactive polypeptide has ten N-terminal AAS deleted. It has antitumour activity greater than hTNF and can be produced by culturing bacteria transformed with a plasmid contg. DNA encoding the polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Use of divalent metal ions for making Apo-2 ligand and in formulations containing Apo-2 ligand for increasing yield and stability of ligand trimers, useful for therapeutic applications -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; Apo2 ligand: divalent metal ions; viral infection; cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a formulation comprising Apo-2 ligand and divalent metal ions. Apo-2 ligand and the formulation are useful for treating cancers and viral infections. Addition of divalent metal ions for making Apo-2 ligand and formulations containing Apo-2 ligand results in increased yield and stability of Apo-2 ligand trimers.
                                                 New bioactive polypeptide - has antitumour activity, and is obtd. by culturing bacteria transformed with plasmid contg. DNA sequence of the polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Length 147;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Leung

The present invention relates to Tumour necrosis factor (TNF) and ApoL-related Leucocyte expressed Ligand 1 (TALL-1) nucleic acid molecules, proteins (including homologues), and their antibodies. The invention in particular relates to methods for regulating the interaction between TALL-1 and TALL-1 receptors (BCMA referred as B cell maturation factor) to regulate monocyte, macrophage and B lymphocyte mediated immune responses. TALL-1 protein is useful for identifying compounds that regulate B lymphocyte proliferation. It is also useful for treating B lymphocyte associated autoimmune disorders like rheumatoid arthritis, systemic lupus erythematosus (SiE), insulin dependent diabetes mellitus, multiple sclerosis, myasthenia gravis, Grave's disease, autoimmune haemolytic anaemia, autoimmune thrombocytopenia purpura, Goodpasture's syndröme, pemphigus vulgaris, acute rheumatic fever,
                                                                                                                                                                                                                                                                                      post streptococcal glomerulonephritis, or polyarteritis nodosa.
The TALL-1 protein and its corresponding nucleic acid sequence are also
                                                                                                                                                                                                                                                                                                                                                  The present sequence is a C-terminal region of human Tumour necrosis factor (TNF) which has 20-25% sequence identity with C-terminal region human TALL-1 protein extracellular domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 1; page 1; 18pp; Japanese.

The mutant has activity 2.8 times that of human TNF.

It is expressed using expression vector pTNF 416 in E.coli.

The cells are then cultured to give the mutant in an amt. of 15.5% of total proteins. The antitumour activity of this protein was measured using mouse L-929 fibroblast cells. 100 microlitres of E.coli lysate contg. 0.00006 units had specific activity of the mutant of 0.000088 units/mg.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The polypeptide was obtd. by cleaving DNA encoding mature TNF. The resulting fragment was then ligated to a synthetic DNA adapter and inserted into an expression vector for prodn. of the polypeptide which has tumoricidal activity. The N-terminal may have up to three residues deleted resulting in N-terminals of: Met-Ser-Asp-Lys, Met-Asp-Lys, or Met-Lys.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Tumoricidal polypeptide(s) - are prepd. by cleaving specified DNA with pertinent restriction enzyme(s) and bonding with conventional synthetic DNA adaptor.
New bioactive polypeptide - having antitumour activity and higher activity than human tumour necrosis factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ó

A recombinant microorganism cell transformed by recombinant plasmid contg. the DNA region coding for the polypeptide is cultured. The polypeptide is isolated from the resulting culture. The microorganism is pref. Escherichia coli.
                                                                                                                                                                                                                                                                                                                                                       New physiologically active polypeptide used as antitumour agent -obtd. by culturing recombinant Escherichia coli cell transformed by plasmid contg. DNA region coding the polypeptide

Sequence 5, Application US/09911777;
Patent No. US20020037862A1
GENERAL INFORMATION:
APPLICANT: BIOGEN, INC.
APPLICANT: BROWNING, Jeffrey
APPLICANT: AMBROSE, Christine
APPLICANT: AMBROSE, Christine
APPLICANT: AMBROSE, Christine
APPLICANT: ACHOPP, Jurg
APPLICANT: SCHNEIDER, Pascal
ITILE OF INVENTION: BAFF, Inhibitors Thereof and Their Use
ITILE OF INVENTION: BAFF, Inhibitors Thereof and Their Use
ITILE OF INVENTION: In the Modulation of B-Cell Response
FILE REFERENCE: A070 US
CURRENT FILING DATE: 1999-01-25
PRIOR APPLICATION NUMBER: 60/114,169
PRIOR FILING DATE: 1999-07-09
PRIOR FILING DATE: 1999-07-09

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                       (without alignments)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 3, Application US/07668517
Patent No. 5262309
GENERAL INFORMATION:
APPLICANT: Satoshi NAKAWURA et al.
APPLICANT: Satoshi NAKAWURA et al.
TITLE OF INVENTION: No. 5262309el Physiologically Active
TITLE OF INVENTION: Polypeptide, Recombinant Plasmid, Recombinant Microorganism
TITLE OF INVENTION: Cell, Pharmaceutical Composition and Method of Recovering
NUMBER OF SEQUENCES: 50
CORRESPONDENCE ADDRESS:
ADDRESSEE: Wenderoth, Lind & Ponack
                  Sequence 15, Application US/07668517

Patent No. 5262309
GENERAL INFORMATION:
APPLICANT: Satoshi NAKAMURA et al.
TITLE OF INVENTION: No. 5262309el Physiologically Active
TITLE OF INVENTION: Polypeptide, Recombinant Plasmid, Recombinant Microorganism
TITLE OF INVENTION: Pollypeptide, Recombinant Microorganism
TITLE OF INVENTION: Cell, Pharmaceutical Composition and Method of Recovering
NUMBER OF SEQUENCES: 50
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 8, Application US/07668517

C; Comment: Secreted from mitogen-activated macrophages within 4-24 hours after induct cout detriment to normal cells. It can also act synergistically with interferon gamma C; Comment: NRS-alpha and -beta (lymphotoxin) are the products of different genes clos ut are produced by different cell types and have different induction kinetics.

Can. J. Vet. Res. 65:233-240(2001).

-I- FUNCTION: Cytokine that binds to TNFRSFIA/TNFR1 and TNFRSFIB/TNFBR. It is mainly secreted by macrophages and can induce cell death of certain tumor cell lines. It is potent pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and is implicated in the induction of cachexia, Under certain conditions it can stimulate cell proliferation and induce cell differentiation (By similarity).

C. -- SUBUNIT: Homotrimer (By similarity).

C. -- SUBCELLULAR LOCATION: Type II membrane protein. Also exists as an extracellular soluble form (By similarity).

C. -- PTM: The soluble form derives from the membrane form by proteolytic processing (By similarity).

C. -- PTM: The membrane form, but not the soluble form, is phosphorylated on serine residues. Dephosphorylation of the membrane form ocurrs by binding to soluble TNFRSFIA/TNFRI (By membrane form ocurrs by binding to soluble TNFRSFIA/TNFRI (By

Bubmitted (xxx-1993) to the EMBL/GenBank/DDBJ databases.
C -- FUNCTION: Cytokine that binds to TWRRSFLA_TWRR and TWRRSFLB_TWRR I is mainly secreted by macrophages and can induce cell death of certain tumor cell lines. It is potent pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and is implicated in the induction of cacheria, under certain conditions it can stimulate cell proliferation and induce cell differentiation.
C -- SUBGINIT: Homotrimer (By similarity).
C -- SUBGILUAR LOCATION Type II membrane protein. Also exists as an extracellular soluble form (By similarity).
C -- PTM: The soluble form derives from the membrane form by proteolytic processing (By similarity).
C -- PTM: The membrane form, but not the soluble form, c -- PTM: The membrane form, but not the soluble form, but not the soluble form, but not the soluble form, c -- PTM: The membrane form by binding to soluble TWRSFIA/TWFRI (By -- Assistance form courrs by binding to soluble TWRSFIA/TWFRI (By -- Assistance form courrs by binding to soluble TWRSFIA/TWFRI (By -- Assistance form courres by binding to soluble TWRSFIA/TWFRI (By -- Assistance form courres by binding to soluble TWRSFIA/TWFRI (By -- Assistance form courres by binding to soluble form the membrane form courres by binding to soluble form the membrane form courres by binding to soluble form the membrane form courres by binding to soluble form the membrane form the membrane form the membrane form the membrane form the soluble form the membrane form the membr

Immunol. 155:3946-3954(1995).

-!- FUNCTION: CYLOKine that binds to TNFRSFIA/TNFRI and TNFRSFIB/TNFRI. To it is mainly secreted by macrophages and can induce cell death of certain tumor cell lines. It is potent pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and is implicated in the induction of achexia, Under certain conditions it can stimulate cell proliferation and induce cell differentiation.

-!- SUBGUIT Homotrimer (By similarity).

-: SUBGUILUMAR LOCATION: Type II membrane protein. Also exists as extracellular soluble form (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             01-FEB-1996 (Rel. 33, Created)

PTM: The soluble form derives from the membrane form by proteolytic processing (By similarity).

PTM: The membrane form, but not the soluble form, is phosphorylated on serine residues. Dephosphorylation of the membrane form ocurrs by binding to soluble TNFRSFIA/TNFRI (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ó;

                                                                                                                                                                                                                                       an
TWFRSFIB/TWFBR. It is mainly secreted by macrophages and can induce cell death of certain tumor cell lines. It is potent pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and is implicated in the induction of cachexia, Under certain conditions it can stimulate cell proliferation and induce cell differentiation.

-1. SUBGURIT: HOMOCIMEN (By similarity).

-1. SUBGELIULAR LOCATION: Type II membrane protein. Also exists as an extracellular soluble form (By similarity).

-1. PTM: The soluble form derives from the membrane form by proteolytic processing (By similarity).

-1. PTM: The membrane form, but not the soluble form, is phosphorylated on serine residues. Dephosphorylation of the membrane form ocurrs by binding to soluble TWFRFIA/TWFRI (By membrane form courrs by binding to soluble TWFRFIA/TWFRI (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CYTOPLASMIC (POTENTIAL).

-!-FUNCTION: Cytokine that binds to TNFRSFIA/TNFRI and
TNFRSFIB/TNFBR. It is mainly secreted by macrophages and can
induce cell death of certain tumor cell lines. It is potent
pyrogen causing fever by direct action or by stimulation of
interleukin 1 secretion and is implicated in the induction of
cachexia, Under certain conditions it can stimulate cell
proliferation and induce cell differentiation.

-!-SUBUNIT: Homotrimer (By similarity).

-:-SUBCELLUIAR LOCATION: Type II membrane protein. Also exists as an
extracellular soluble form (By similarity).

-:-PTM: The soluble form derives from the membrane form by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CANCER AND INFECTION, AND IS CHARACTERIZED BY GENERAL ILL HEALTH
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DISEASE: CACHEXIA ACCOMPANIES A VARIETY OF DISEASES, INCLUDING

CO -1- FUNCTION: Cytokine that binds to PURREFIA-TNFR1 and
TNFRSFIB/TNFBR. It is mainly secreted by macrophages and can
induce cell death of certain tumor cell lines. It is potent
pyrogen causing fever by direct action or by stimulation of
cochexia, Under certain conditions it can stimulate cell
cachexia, Under certain conditions it can stimulate cell
cochexia, Under certain conditions it can stimulate cell
cochexia, Under certain conditions it can stimulate cell
cochexia, Under certain differentiation (By similarity).

C. :- SUBGNUT: Homorrimer (By similarity).

C. :- SUBCILULAR LOCATION: Type II membrane protein. Also exists as an
extracellular soluble form (By similarity).

C. :- PTM: The soluble form derives from the membrane form by
proteclytic processing (By similarity).

C. :- PTM: The membrane form, but not the soluble form by

of two members of the TNF-superfamily in cattle: CD40 ligand
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DISEASE: CACHEXIA ACCOMPANIES A VARIETY OF DISEASES, INCLUDING CANCER AND INFECTION, AND IS CHARACTERIZED BY GENERAL ILL HEALTH
                                                                                                                                                                                                                                                                     proliferation and induce cell differentiation.
--- SUBGNIT: Homotrimer (By similarity).
--- SUBGLULAR LOCATION: Type II membrane protein. Also exists as extracellular soluble form (By similarity).
--- PTM: The soluble form derives from the membrane form by proteolytic processing (By similarity).
--- PTM: The membrane form, but not the soluble form, is phosphorylated on serine residues. Dephosphorylation of the membrane form ocurrs by binding to soluble TNFRSFIA/TNFRI (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             TUMOR NECROSIS FACTOR, MEMBRANE FORM. -!- FUNCTION: CYTCAINE that binds to TNFRSFIA/TNFR1 and
TNFRSFIB/TNFBR. It is mainly secreted by macrophages and can
induce cell death of certain tumor cell lines. It is potent
pyrogen causing fever by direct action or by stimulation of
interleukin 1 secretion and is implicated in the induction of
cachexia, Under certain conditions it can stimulate cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

Am. J. Physiol. 273:1254-L530(1997).

-!-PUNCTION: Cytokine that binds to TNFRSFIA/TNFR1 and TNFRSFIB/TNFRB.";

-!-PUNCTION: Cytokine that binds to TNFRSFIA/TNFR1 and Induce cell death of certain tumor cell lines. It is potent pyrogen causing fever by direct action or by stimulation of interleukin i secretion and is implicated in the induction of cachexia, Under certain conditions it can stimulate cell proliferation and induce cell differentiation.

-!-SUBJUIT: HOMOCITION: Type II membrane protein. Also exists as an extracellular soluble form (By similarity).

-!-PTM: The soluble form (By similarity).

-!-PTM: The soluble form (By similarity).

-!-PTM: The membrane form, but not the soluble form, is phosphorylated on serine residues. Dephosphorylation of the membrane form currs by binding to soluble TNFRSFIA/TNFRI (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           EXTRACELLULAR (POTENTIAL).

Cell Biol. 69:273-283(1991).

-I-FUNCTION: Cytokine that binds to TNFRSFIA/TNFR1 and TNFRSFIB/TNFBR. It is mainly secreted by macrophages and can induce cell death of certain tumor cell lines. It is potent pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and is implicated in the induction of cachexia, Under certain conditions it can stimulate cell proliferation and induce cell differentiation.

-I-SUBUNIT: Homotrimer (By similarity).

-I-SUBCELLULAR LOCATION: Type II membrane protein. Also exists as an extracellular soluble form (By similarity).
                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DISEASE: CACHEXIA ACCOMPANIES A VARIETY OF DISEASES, INCLUDING CANCER AND INFECTION, AND IS CHARACTERIZED BY GENERAL ILL HEALTH
